Chapter 22
Dark Matter, Dark Energy, and the Fate of the Universe

Agenda
• Hand Back tests
• Ch. 22
• ?

22.1 Unseen Influences in the Cosmos

• Our goals for learning
• What do we mean by dark matter and dark energy?

What do we mean by dark matter and dark energy?

Unseen Influences

Dark Matter: An undetected form of mass that emits little or no light but whose existence we infer from its gravitational influence

Dark Energy: An unknown form of energy that seems to be the source of a repulsive force causing the expansion of the universe to accelerate

Contents of Universe

• “Normal” Matter: ~ 4.4%
  – Normal Matter inside stars: ~ 0.6%
  – Normal Matter outside stars: ~ 3.8%
• Dark Matter: ~ 25%
• Dark Energy ~ 71%
What have we learned?

- What do we mean by dark matter and dark energy?
  - “Dark matter” is the name given to the unseen mass whose gravity governs the observed motions of stars and gas clouds.
  - “Dark energy” is the name given to whatever might be causing the expansion of the universe to accelerate.

22.2 Evidence for Dark Matter

- Our goals for learning
  - What is the evidence for dark matter in galaxies?
  - What is the evidence for dark matter in clusters of galaxies?
  - Does dark matter really exist?
  - What might dark matter be made of?

What is the evidence for dark matter in galaxies?

We measure the mass of the solar system using the orbits of planets.

Or for circles:
- Orb. Period
- Avg. Distance

Who has the largest orbital velocity?
- A, B, or C?
Who has the largest orbital velocity? A, B, or C?

Answer: C

Rotation curve of merry-go-round rises with radius of distance.

Rotation curve of Milky Way stays flat with distance.

Mass must be more spread out than in solar system.

Mass in Milky Way is spread out over a larger region than the stars.

Most of the Milky Way’s mass seems to be dark matter!

Mass within Sun’s orbit:

\[ 1.0 \times 10^{11} \, M_{\text{Sun}} \]

Total mass:

\[ \sim 10^{12} \, M_{\text{Sun}} \]

The visible portion of a galaxy lies deep in the heart of a large halo of dark matter.
We can measure rotation curves of other spiral galaxies using the Doppler shift of the 21-cm line of atomic H. Spiral galaxies all tend to have flat rotation curves indicating large amounts of dark matter.

Thought Question

What would you conclude about a galaxy whose rotational velocity rises steadily with distance beyond the visible part of its disk?

A. Its mass is concentrated at the center
B. It rotates like the solar system
C. It’s especially rich in dark matter
D. It’s just like the Milky Way

Thought Question

What is the evidence for dark matter in clusters of galaxies?
We can measure the velocities of galaxies in a cluster from their Doppler shifts.

The mass we find from galaxy motions in a cluster is about **50 times** larger than the mass in stars!

Clusters contain large amounts of X-ray emitting hot gas.

Temperature of hot gas (particle motions) tells us cluster mass:

- 85% dark matter
- 13% hot gas
- 2% stars

**Gravitational lensing**, the bending of light rays by gravity, can also tell us a cluster’s mass.

All three methods of measuring cluster mass indicate similar amounts of dark matter.
**Thought Question**

What kind of measurement does not tell us the mass of a cluster of galaxies?

A. Measure velocities of cluster galaxies  
B. Measure total mass of cluster’s stars  
C. Measure temperature of its hot gas  
D. Measure distorted images of background galaxies

**Our Options**

1. Dark matter really exists, and we are observing the effects of its gravitational attraction
2. Something is wrong with our understanding of gravity, causing us to mistakenly infer the existence of dark matter

*Because gravity is so well tested, most astronomers prefer option #1*

---

**Thought Question**

What kind of measurement does not tell us the mass of a cluster of galaxies?

A. Measure velocities of cluster galaxies  
B. Measure total mass of cluster’s stars  
C. Measure temperature of its hot gas  
D. Measure distorted images of background galaxies

---

**Our Options**

1. Dark matter really exists, and we are observing the effects of its gravitational attraction
2. Something is wrong with our understanding of gravity, causing us to mistakenly infer the existence of dark matter

---

**What might dark matter be made of?**
How dark is it?

... not as bright as a star.

Two Basic Options

- Ordinary Dark Matter (MACHOS)
  - Massive Compact Halo Objects: dead or failed stars in halos of galaxies

- Extraordinary Dark Matter (WIMPS)
  - Weakly Interacting Massive Particles: mysterious neutrino-like particles

The Best Bet

MACHOs occasionally make other stars appear brighter through lensing

... but not enough lensing events to explain all the dark matter
Why Believe in WIMPs?

- There’s not enough ordinary matter
- WIMPs could be left over from Big Bang
- Models involving WIMPs explain how galaxy formation works

What have we learned?

- What is the evidence for dark matter in galaxies?
  - Rotation curves of galaxies are flat, indicating that most of their matter lies outside their visible regions
- What is the evidence for dark matter in clusters of galaxies?
  - Masses measured from galaxy motions, temperature of hot gas, and gravitational lensing all indicate that the vast majority of matter in clusters is dark

What have we learned?

- Does dark matter really exist?
  - Either dark matter exists or our understanding of our gravity must be revised
- What might dark matter be made of?
  - There does not seem to be enough normal (baryonic) matter to account for all the dark matter, so most astronomers suspect that dark matter is made of (non-baryonic) particles that have not yet been discovered

22.3 Structure Formation

- Our goals for learning
- What is the role of dark matter in galaxy formation?
- What are the largest structures in the universe?

What is the role of dark matter in galaxy formation?

Gravity of dark matter is what caused protogalactic clouds to contract early in time
WIMPs can’t contract to center because they don’t radiate away their orbital energy.

Dark matter is still pulling things together. After correcting for Hubble’s Law, we can see that galaxies are flowing toward the densest regions of space.

What are the largest structures in the universe?

Models show that gravity of dark matter pulls mass into denser regions – universe grows lumpier with time.
What have we learned?

- What is the role of dark matter in galaxy formation?
  - The gravity of dark matter seems to be what drew gas together into protogalactic clouds, initiating the process of galaxy formation

- What are the largest structures in the universe?
  - Galaxies appear to be distributed in gigantic chains and sheets that surround great voids

22.4 The Fate of the Universe

- Our goals for learning
- Will the universe continue expanding forever?
- Is the expansion of the universe accelerating?

Does the universe have enough kinetic energy to escape its own gravitational pull?

Fate of universe depends on the amount of dark matter:

- Lots of dark matter
- Critical density of matter
- Not enough dark matter
Amount of dark matter is ~25% of the critical density suggesting fate is eternal expansion.

But expansion appears to be speeding up!

Dark Energy?

Not enough dark matter

Estimated age depends on both dark matter and dark energy.

Is the expansion of the universe accelerating?

Accelerating universe is best fit to supernova data.

Brightness of distant white-dwarf supernovae tells us how much universe has expanded since they exploded.

Estimated age is based on both dark matter and dark energy.
What have we learned?

- **Will the universe continue expanding forever?**
  - Current measurements indicate that there is not enough dark matter to prevent the universe from expanding forever

- **Is the expansion of the universe accelerating?**
  - An accelerating universe is the best explanation for the distances we measure when using white dwarf supernovae as standard candles
