

| Number Produced | Cost per item |
|-----------------|---------------|
| 10 | 2.35 |
| 50 | 2.22 |
| 100 | 2.11 |
| 150 | 2.01 |
| 200 | 1.98 |

Linear function which is the best fit to above data:

Predicted cost per item if producing 1000 items:

Using the inverse of the best fit, predict how many items were produced:

| Cost per Item | Expected Number Produced: |
|---------------|---------------------------|
| 1.78 | |
| 1.68 | |
| 1.58 | |
| 1.48 | |

Plot the parabola: $P(x)=x^2+5x-10$ and locate the zeros accurate to the one's digit

| x | P(x) |
|-----|------|
| -10 | |
| -9 | |
| -8 | |
| -7 | |
| -6 | |
| -5 | |
| -4 | |
| -3 | |
| -2 | |
| -1 | |
| 0 | |
| 1 | |
| 2 | |
| 3 | |
| 4 | |
| 5 | |
| 6 | |
| 7 | |
| 8 | |
| 9 | |
| 10 | |

Plot $f(x)=8^x$ from -10 to 10 and also compute the log base 8 of $f(x)$

| x | $f(x)=8^x$ | $f^{-1}(x)=\log_8(x)$ |
|------|------------|-----------------------|
| -10 | | |
| -9.5 | | |
| -9 | | |
| -8.5 | | |
| -8 | | |
